bisoftQM
Quality management

Quality as a competitive advantage

bisoftQM is the hub for quality-relevant data in production. bisoftQM provides fundamental data based on control plans and is the active tie between staff, machines, plants and tools when QM specifications must be adhered to. Connected metering machines can be provided with article-relevant set and action points. Units can be stopped via process locking if test cycles are reached or if individual QM values deviate. Production as also weak spot analysis is continually available and can be scaled to suit your enterprise. This results in a reduction of stoppages and of additional unplanned maintenance and rejects. bisoftQM permits consistent tracing and documentation of products and processing with regard to quality data. if product recalls are necessary, relevant batches can be identified precisely and extra costs reduced noticeably.

bisoftQM — Quality in focus
